                                          The invention relates to a novel method for identifying a subject at risk of breast cancer comprising detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a subject at risk of breast cancer, for early diagnosis, prevention and treatment of breast cancer, possibly via gene therapy, as well as to analyse and predict a response to a breast cancer treatment and in clinical drug trials. The current sequence is that of an Extend primer (also described as probe) of the invention which was used to genotype human intercellular adhesion molecule ICAM-1/ICAM-4/ICAM-5 gDNA. ICAM-1 (human rhinovirus receptor;BB2 ;CD54,cell surface glycoprotein P.35) has been mapped to chromosomal position 19p13.2-cn and ICAM-5 been mapped to chromosomal position 19p13.2-cn and ICAM-5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CD54; cell surface glycoprotein P3.58; ICAM-4; Landsteiner-Wiener blood group; ICAM-5; telencephalin; chromosome 19p13; ss; primer; PCR; SNP; single nucleotide polymorphism; probe.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Best Local Similarity Matches 15; Conserv
                                                                                                                                                                                                                                                                                                 Primer t63-r2 and t63-f2 (see AAV62682) are based on the 3' untranslated region of the human Tango-63 gene. They were used in mapping studies of the Tango-63 gene. The gene has been mapped on the Stanford Human Genome Center G3 radiation hybrid panel close to marker D8S1734 with a LOD score of 6. This map position is located in the most frequently lost region of chromosome 8 between markers D8S133 and NEFL. Tango-63 is alternatively spliced (see AAV62672-73) to produce the Tango-63d and Tango-63e polypeptides (see AAW79260-61) of the invention. Tango-63 nucleic acids and polypeptides are used in meethods for the diagnosis and treatment of apoptosis-related disorders such as cancer, autoimmune and neurodegenerative disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Isolated tumour necrosis factor related proteins - used to develop products for the diagnosis and treatment of apoptosis-related disorders, e.g. cancers, auto:immune disorders or neuro:degenerative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI; 1998-594562/50
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          16-APR-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention provides antisense compounds capable of inhibiting the expression of human Her-3, a member of epidermal growth factor (EGF) family of receptor/tyrosine kinases. The antisense oligonucleotides are useful for inhibiting the expression of Her-3 in cells or tissues. They are commonly used as research reagents and in diagnostics for example, to elucidate the function of particular genes. The antisense compounds are also useful for distinguishing between functions of various members of a biological pathway and for research use. They are also utilized for distinguishing between functions of various members of a biological pathway and for research use. They are also utilized for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antisense compounds capable of modulating expression of human Her-3, member of epidermal growth factor family of receptor/tyrosine kinases, useful for preventing or delaying infection, inflammation or tumor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Her-3; epidermal growth factor; EGF; receptor/tyrosine kinase; human; antiinflammatory; cytostatic; antibacterial; antisense; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                biological pathway and for research use. They are also utilized for diagnostice, therapeutics, prophylaxis and in kits. They are useful prophylactically, e.g. to prevent or delay infection, inflammation or tumor formation. Sequences AAH47532-47615 represent chimeric antisense phosphorothicate oligonucleotides having 2'-MOE wings and a deoxy gap,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to the isolation of novel human and mouse VMGLOM polypeptides (long form and short form), and the nucleic acid molecules encoding them. VMGLOMs (also referred to as glomulins) are a subtype of venous malformations (VMs) called glomangiomas. In humans, VMGLOM has been mapped to chromosome 1p21-22. VMGLOMs and the nucleic acids encoding for them are useful as a medicament or for incorporation into a diagnostic kit. Such medicaments are useful for preventing, treating or alleviating disorders with a vascular component, particularly where alteration of vascular smooth muscle cell phenotype is needed, e.g. varicosities, cardiopathies or cardiomyopathies, cerebral disorders and cancer. The nucleic acids are also useful in gene therapy. The present sequence for PCR primer 1 is used to amplify PAC 10406 (70 SP6) clone STS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New VMGLOM genes and polypeptides, useful in gene therapy or for preventing, treating or alleviating disorders with vascular component, e.g. varicosities, cardiopathies, cerebral disorders or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      23-AUG-2001

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   predisposition for or the occurrence of neurodegenerative disease in a subject. The method comprises detecting in a target nucleic acid obtaine from the subject the presence or absence of an allelic variant of one or more polymorphic regions of one or more genes selected from upA (Urokinase plasminogen activator), SNCG (gamma-synuclein), IDE (insulindegrading enzyme), KNSLI (Kinesin-like protein 1), LIPA (lyosomal acid lypase), and TNFRSP6 (Tumour Necrosis Factor Receptor-SF6), where the presence of at least one of the allelic variant of one or more polymorphic regions is indicative of a predisposition for or the occurrence of neurodegenerative disease. The genes are all located on chromosome 10. M1 is useful for determining a predisposition for or the occurrence of, and for treating neurodegenerative disease, particularly Alzheimer's disease. The present sequence is a PCR primer, which was use in the method of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cy thymotaxin (also known as Tango-45), Tango-63d, Tango-637e, Tango-67, or thuchordin polypeptide, including sequences 90% identical to them, compared to a host cell or a non-mammalian host cell containing the novel nucleic acid, the encoded polypeptides (or allelic variants, sequences 90% cidentical or fragments), an antibody or antibody substance that compound that binds with one of the proteins, and identifying a compound that binds with the proteins and/or modulates the proteins' activity. Thymotaxin is a member of the C-C family of chemokines, Tango-63e and -d are members of the tumour necrosis factor superfamily, Tango-67 is a growth factor family member. The Thymotaxin gene is located on human cohromosome 16 and Tango-63 on chromosome 8. The nucleic acid molecules are useful for diagnosing and treating disorders cand polypeptides are useful for diagnosing and treating disorders cand polypeptides are useful for diagnosing and treating disorders compolypeptides are useful for diagnosing and treating disorders complypeptides are useful for diagnosing and treating disorders and polypeptides are useful as inflammation (e.g. viral encephalitis, viral or polypeptides are useful assesse (e.g. viral encephalitis, viral or polypeptides are useful disease (e.g. chronic myelogenous leukaemia or polypeptides are useful assesses (e.g. angina pectoris, myocardial infarction, hypertension or atthretis, type I diabetes, septic shock, e.g. angina pectoris, myocardial infarction, hypertension or cachexia), cardiovascular disorders (e.g. angina pectoris, myocardial infarction, hypertension or polymorphisms in the gene. The methods are useful for identifying compounds that modulate the expression or activity of the polypeptides are useful as primers or probes to detect mutations or polymorphisms in the gene. The methods are useful for identifying compounds that modulate the expression or activity of the polypeptides. The polypeptides are useful as pectoris as a pectorial particular as primers are useful for the polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

                                                                                                                                                                                                                                                                                                    for or the occurrence of neurodegenerative disease comprising detecting in a target nucleic acid obtained from the subject the presence of an allelic variant of polymorphic regions of human genes selected from urokinase plasminogen activator (uPA), gamma-synuclein (SNCG), insulin degrading enzyme (IDE), kinesin-like protein 1 (KNSL1), lysosomal acid lipase (LIPA) and tumour necrosis factor receptor SP6 (TWFRSF6). The method is useful in determining the presence or predisposition to a neurodegenerative disease, particularly Alzheimer's disease. The present sequence is that of a PCR primer which was used for amplification of a region of the human KNSL1 gene in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           melanoma. The present DNA sequence represents an extension that was used to detect single nucleotide polymorphisms wit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention comprises a method for identifying a subject at risk of melanoma. The invention involves detecting the presence or absence of or more polymorphic variations associated with melanoma in the neuropi (NRP1) or mannose receptor C type 2 (MRC2) genes. The method of the invention is useful for identifying subjects at risk and treating melanoma. The present DNA sequence represents an extension PCR primer that was used to detect single nucleotide polymorphisms within human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying a subject at risk of melanoma, useful for treating comprises detecting the presence or absence of one or more poly variations associated with melanoma in a nucleic acid sample fr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 2004-411720/38.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC polynucleotide sequences: The sequences can be used in gene and protein contempy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases cascolated with inappropriate expression of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or content of the patient sequences and patient sequences or to supplement the patients own content of polypeptide. Additionally, (I) and its complementary content of polypeptide as DNA probes in diagnostic assays to detect cand quantitate the presence of similar nucleate acids in samples, and content of polypeptides may be used as antigens in the production of polypeptides of therefore which patients may be used as antigens in the production of polypeptides encoded by (I) may be used as antigens in the production of polypeptides encoded by (I) may be used as antigens in the production of contibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

cc polynucleotide sequences. The sequences can be used in gene and protein cc therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases cc associated with inappropriate expression of polymorphic polypeptides. For cc example, (I) may be used to treat disorders by rectifying mutations or cc deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own cc production of polypeptides. Additionally, (I) and its complementary cc and quantitate the presence of similar nucleic acids in samples, and ct herefore which patients may be in need of restorative therapy. The cc polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic columns and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic columns the production of columns and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic columns the presence and the presence of po

AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs). AAM53114 to AAM53129 represent peptides related to human polymorphic polynucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  associated with inappropriate expression of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; single nucleotide polymorphism; SNP; genome; gene therapy; protein therapy; vaccine; probe; diagnostic assay; detection; quantitation; restorative therapy; polymorphic; ds.

The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic because as diagnostic agents for detecting the presence of polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; single nucleotide polymorphism; SNP; genome; gene therapy; protein therapy; vaccine; probe; diagnostic assay; detection; quantitation; restorative therapy; polymorphic; ds.

polymucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also

sequences (I), which contain single nucleotide polymorphisms (SNPs). AAM53114 to AAM53329 represent peptides related to human polymorphic polynucleotide sequences. The sequences can be used in gene and protein

AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide

                                                                                                                                                                                          This antisense oligonucleotide was designed to hybridise to the 3'-UTR human ICAM-1 mRNA. The same sequence was synthesised in phosphodiester and phosphorothioate forms. The oligonucleotides were tested for inhibition of ICAM-1 expression on the surface of interleukin-1-beta-stimulated cells in two different cell lines. The phosphodiester oligonucleotide did not inhibit ICAM-1 expression, but the phosphorothioate (P=S) form did. See AAQ22629-Q22631 and AAQ22633
                                                                                                                                                                                                                                                                                                                                                                                                                               14-AUG-1990;

Residues 11 and 12 are linked via an oxyloso group (i.e. nucleotides that have xylose sugar linked via the oxylene ring). The sequence is designed to target the Herpes Simplex virus I beginning at nucleotide 10996 and to covalently cross-link to it. See also AAQ20151

The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. CC The synthetic oligomer is capable of forming a triplex at physiological CC pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is a herpes CC simplex virus I duplex beginning at nucleotide 10996 contg. a purine-rich CC region concentrated on one chain of the duplex. The oligomer, and others CC like it are useful in diagnosis and therapy of diseases characterised by Specific DNA duplex targets, e.g. respiratory syncytial virus, HIV. CC specific DNA duplex targets, e.g. respiratory syncytial virus, HIV. CC form under mild conditions thus assays may be carried out without CC subjecting the test specimen to harsh conditions. The oligomer contains CC an inverted polarity region formed from an o-xyloso dimer synthon. The CC inking gp. is o-xyloso (nucleotides have the 3' positions of xylose CC sugars linked via the o-xylene ring). Two nucleotides are coupled through CC axylene residue to form the dimer synthon. This additional modifications CC may render the oligomer stable to nuclease activity. The oligomer is able to inhibit gene expression, as verified by in vitro systems. See also CC field 1

                                                                                                                                                                 Antisense oligonucleotides which target human ICAM-1 were synthesised in both the phosphodiester and phosphorothicatte forms. The oligonucleotides are useful to treat diseases which are modulated by changes in intercellular adhesion molecules. This sequence corresponds to nucleotides 2849-2866 of the 3'- untranslated region of the human ICAM-1 coding sequence. (Updated on 25-MAR-2003 to correct PN field.)

method involves binding the antigen to a solid support and then reacting it with an immunoreactive ligand (L) bound to an oligo; removing any CC unreacted L, and then detecting the presence of the oligo. A similar CC method can be used to detect Abs, in which case the ligand is an oligo-CC labelled Ag. The use of an amplifiable oligo as the label allows Ag or Ab CC to be detected at very low levels. An exemplary oligi is AAQ75024 which CC can be covalently attached by the 5'- terminus to the N-or C-terminal of CC oligo AAQ75024 using disuccinimidyl suberate. Serum samples suspected to CC contain HEV Abs were immobilised on plastic tubes or wells, then CC esparate tube using as primers AAQ75025 and AAQ75026 in 30 cycles of PCR. CC meshed; bound oligo was released with 0.2M glycine and amplified in a CC separate tube using as primers AAQ75025 and AAQ75026 in 30 cycles of PCR. CC The amplification product - AAQ75031 - was treated with uracil DNA CC immoblised oligo-dT. (Updated on 25-MAR-2003 to correct PN field') CX immoblised oligo-dT. (Updated on 25-MAR-2003 to correct PN field')

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAR62941 and AAR62942 are examples of synthetic immunoreactive peptides. They are used in a method for detecting an antigen in a subject. The method involves binding the artiss of synthetic immunoreactive peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Solid phase immunoassay using oligo:nucleotide as label - also new conjugates of oligo:nucleotide coupled to antigenic peptide, partic. diagnosing hepatitis C or E virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Synthetic oligo;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI; 1995-006819/01.

The PNAs can be used to target RNA and single stranded DNA (sbDNA) to produce antisense-type gene regulation moieties. Hence they may be used therapeutically for modulating callular adhesion and thus as
                                                                                                                                                                                                                                                                                                                                                                                                                                                      AIDS agents and anticancer agents, antirhinoviral agents, anti-
AIDS agents and antiinflammatory agents. They may also be useful as
diagnostics, e.g. as probes for specific mENMAs. PNA oligomers have high
affinity for complementary single stranded DNA. They are also able to
form triple helices in which a first PNA strand binds with RNA or ssDNA
and a second PNA strand binds with the resulting double helix or with the
first PNA strand. The PNAs possess no significant charge and are water
soluble, which facilitates cellular uptake. Further, since they contain
amides of non-biological amino acids, they are biostable and resistant to
enzymatic degradation by proteases. The present sequence targets human
intercellular adhesion molecule-1 (ICAM-1) 3' untranslated region

The MMS are polymorphic, simple sequence repeats and can be used in automated genotyping. esp. fluorescence-based. The primers correspond to the unique DNA sequence surrounding each marker, and PCR is used to detect each polymorphism. When the MMS show considerable polymorphism (ie. a polymorphism. When the MMS show considerable polymorphism (ie. a colfiference in the number of repeats) between individuals, the markers can be particularly informative. The MMS can be ideal for linkage studies. Kits comprise at least 4 groups, of at least 3 sets, each comprising labelled primers for PCR amplification of the DNA. Group 4 primer pairs care shown in AAQ95465-480 and AAQ95559-590. The chromosomal markers, published size range of the allele and degree of heterozygosity in the population for the markers covered by these primer pairs are not given in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ICAM-1, ELAM-1, and VCAM-1 represent three of the five cell adhesion molecules involved in the adherence of white blood cells to vascular endothelium. These sequences can be used in a composition for treating allograft rejection. The composition contains one of these sequences in combination with an immunosuppressive agent. The immunosuppressive agent used in the compositions is brequinar, rapamycin, anti-lymphocyte serum, a monoclonal antibody against LFA-1 or an antisense oligonucleotide. The such as cardiac or renal allograft rejection. By using these compositions, allograft survival times are extended, and donor-specific transplant tolerance is induced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAT30211-T30233, AAT33058-T33112 and AAT36667-T36684 represent antisense oligonuclectides of the invention. These sequences target regions of the coding sequences for human intercellular adhesion molecule-1 (ICAM-1), endothelial leukocyte adhesion molecule-1 (ELAM-1, also known as Eselectin), or vascular cell adhesion molecule-1 (VCAM-1). This sequence targets the 3' untranslated region (nucleotides 2849-2866) of ICAM-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 18 BP; 4 A; 1 C; 11 G; 2 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Oligo:nucleotide targetted to a nucleic acid sequence encoding ICAM-1, ELAM-1 or VCAM-1 - useful for treating or preventing allo:graft
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WO9615780-A1

They were used to prime cDNA synthesis from snapdragon (Antirrhinum majus) petal and leaf RNA, and were also utilised in the PCR amplification of plant cytochrome P450 sequences (see also AAT94670-73). A cDNA clone (see AAT94657) encoding flavonoid 3' hydroxylase (see AAW35704) was isolated using a differential display approach. This can be used to manipulate the pigmentation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel flavonoid 3'-hydroxylase(s) from flowering plants - and corresponding DNA, used in the manipulation of pigmentation in plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Brugliera F,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                polyT-anchC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0
```

The invention relates to an analytical method for determining the

nucleotide sequence of nucleic acid analytes, including chemical modified oligonucleotides. This new method utilises electrospray

including chemically

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ionisation-Fourier transform mass spectrometry. The ions are excited by sustained off-resonance excitation with single shot excitation, and the target fragmented by collisionally activated dissociation by a neutral gas, e.g. carbon dioxide. Alternatively, the excitation and dissociation can be nozzle skimmer dissociation. The method is used in molecular biology and biomedical applications. The method, utilising electrospray ionisation-Fourier transform ion cyclotron resonance mass spectrometry, is extremely rapid and acts directly on the oligonucleotide. The method is effective for a variety of nucleic acid analytes, particularly chemically modified oligonucleotides which have not previously been successfully sequenced. The present sequence represents a phosphorothioate oligodeoxymucleotide
This antisense oligonucleotide is nuclease resistant and can be used in the treatment of animals, including humans, having a bacterial infection. The treatment comprises administration of such nuclease resistant oligonucleotides, targeted to a nucleic acid or protein of the bacterium, and formulated with a carrier. A compound comprising this nuclease resistant oligonucleotide can be covalently linked to an antibiotic. The method is used to treat infections by a wide variety of Gram-positive and Gram-negative, or acid-fast, bacteria, in human and veterinary medicine. The methods are particularly used in immuno-compromised individuals (e.g. patients with acquired immunodeficiency syndrome or those receiving
                                                                                                                                                                                              Claim
                                                                                                                                                                                                                                                  Treating bacterial infections in humans or animals with oligo:nucleotide(s) - resistant to nuclease and targetted to bacterial nucleic acid or proteins, also conjugates of these oligo:nucleotide(s)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Synthetic.

They may also activate RNase H and have a general, non-specific immune-stimulating effect. The oligonucleotides can be administered orally, intranasally, rectally, topically or by injection, optionally coupled to an agent (e.g. carbohydrate or polyamine) that enhances cellular uptake
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           chemotherapy or radiation therapy), optionally in combination with, or fused to, antiviral or other antimicrobial oligonucleotides. Apart from therapeutic use, the oligonucleotides can be used to control bacteria in laboratory cultures, foods, beyerages and industrial processes. The
                                                                                                                             A method has been developed for labelling an oligonucleotide having a repeated sequence of (XY)n (where X and Y consists of a combination of adenine and thymine or uracil or guanine and cytosine, and n is an integer of 1 or more ) at the 3'-terminal side in which the repeated sequence is added and extended using a labelled body of the nucleotide constituting the repeated sequence and a DNA polymerase lacked in 5' to

The method can be used for detecting a gene. The method can detect a gene in a sensitivity up to ten times higher than prior art methods. The present sequence represents a primer used in an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula: (X)m5-(alpha)n-beta -N3', or (X)m5-(gamma)k-delta-N3', where X = a labelled compound and/or a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or thymine; gamma = thymine; k = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene
                                                                                                                                                                                                                                                                                                                     ITR sequence; pentanucleotide tandem repeat; stutter artifact; DNA typing; DNA profiling; linkage analysis; criminal justice; paternity testing; animal lineage analysis; microsatellite loc

The method is useful in DNA CC profiling for linkage analysis, criminal justice, paternity testing and CC the lineage of horses, dogs and other prize animals. The invention overcomes problems related to the use of microsatellite loci in DNA profiling. The method can detect polymorphisms with a low incidence of containing the content of loci. The development of markers based on larger callelic content of loci. The development of markers based on larger called to the sequence aparation of the fragments on the sequence of more loci.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

inhibit retroviral replication. The oligoarabinonucleotides can also be used, in combination with RNase H, as reagents for sequence-specific cleavage or RNA mapping, and additionally for the study and control of gene expression in cells. The oligoarabinonucleotides have excellent affinity for RNA, increased resistance to nucleases and show little if any non-specific binding to cellular or serum proteins. They target as RNA, but not complementary ss DNA, so may be useful for targetting retroviral genomic RNA to inhibit the early stages of viral replication. Oligoarabinonucleotides containing pyrimidine bases form triple helices with significantly higher thermal stability than those produced by norma oligoarabinonucleotides. Sequences AAZ87160-287164 represent oligoarabinonucleotides containing beta-D-arabinose used in an exemplification of the present invention oligoarabinonucleotides are used for antisense inhibition of gene expression or to prevent DNA replication, or reverse transcription of RNA by retroviruses. The compositions are therefore particularly used to can hybridise to either a a single-stranded (ss) RNA to induce I cleavage activity, or to a DNA/DNA or DNA/RNA duplex to form a leading, thereby inhibiting DNA replication and/or transcription. The invention relates to a new composition for selective, se specific inhibition of gene transcription and expression in composition comprises oligonuclectides containing arabinose ression in a host. The arabinose sugars that a triple

The oligoarabinonucleotides can also be used, in combination with RNase H, as reagents for sequence-specific cleavage or RNA mapping, and additionally for the study and control of gene expression in cells. The oligoarabinonucleotides have excellent affinity for RNA, increased resistance to nucleases and show little if any non-specific binding to cellular or serum proteins. They target ss RNA, but not complementary ss DNA, so may be useful for targetting retroviral genomic RNA to inhibit the early stages of viral replication. Oligoarabinonucleotides containing pyrimidine bases form triple helices with significantly higher thermal stability than those produced by normal oligoarabinonucleotides. Sequences AAZ87160-Z87164 represent oligoarabinonucleotides containing beta-D-arabinose used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Therapeutic composition containing antisense oligonucleotides that include arabinose sugars, particularly for inhibiting viral replication.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cleavage activity, or to a DNA/DNA or DNA/RNA duplex to form a triple helix, thereby inhibiting DNA replication and/or transcription. The oligoarabinonucleotides are used for antisense inhibition of gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 1; Page 29; 91pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC oligoarabinonuclectides are used for antisense inhibition of gene carpression or to prevent DNA replication, or reverse transcription of RNA CC by retroviruses. The compositions are therefore particularly used to cinhibit retroviral replication. The oligoarabinonuclectides can also be CC used, in combination with RNase H, as reagents for sequence-specific CC cleavage or RNA mapping, and additionally for the study and control of CC gene expression in cells. The oligoarabinonuclectides have excellent CC affinity for RNA, increased resistance to nucleases and show little if CC any non-specific binding to cellular or serum proteins. They target ss CC RNA, but not complementary ss DNA, so may be useful for targetting CC coligoarabinonucleotides containing pyrimidine bases form triple helices CC with significantly higher thermal stability than those produced by normal CC oligonucleotides. Sequences AZEP165-ZEP169 represent CC oligodeoxyarabinonucleotides containing 2'-deoxy-2'fluoro-beta-D-CC arabinose used in an exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      used, in combination with RNASE H, as reagents for sequence-specific cleavage or RNA mapping, and additionally for the study and control of gene expression in cells. The oligoarabinonucleotides have excellent affinity for RNA, increased resistance to nucleases and show little if any non-specific binding to cellular or serum proteins. They target ss RNA, but not complementary ss DNA, so may be useful for targetting retroviral genomic RNA to inhibit the early stages of viral replication. Oligoarabinonucleotides containing pyrimidine bases form triple helices with significantly higher thermal stability than those produced by normal oligonucleotides. Sequences AAS07165-287169 represent oligodeoxyarabinonucleotides containing 2'-deoxy-2'fluoro-beta-D-arabinose used in an exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               specific inhibition of gene transcription and expression in a host. The composition comprises oligonucleotides containing arabinose sugars the can hybridise to either a a single-stranded (ss) RNA to induce RNase to cleavage activity, or to a DNA/DNA or DNA/RNA duplex to form a triple helix, thereby inhibiting DNA replication and/or transcription. The oligoarabinonucleotides are used for antisense inhibition of gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   expression or to prevent DNA replication, or reverse transcription of RNA by retroviruses. The compositions are therefore particularly used to inhibit retroviral replication. The oligoarabinonucleotides can also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Therapeutic composition containing antisense oligonucleotides that include arabinose sugars, particularly for inhibiting viral replication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Damha MJ,

cc antisense oligonuclectides are targeted to a nucleic acid encoding a cellular adhesion molecule (CAM) and is capable of modulating the CC empression of the CAM. They particularly inhibit intercellular adhesion completed to a nucleic acid encoding a cemposal of the CAM. They particularly inhibit intercellular adhesion of the CAM. They particularly inhibit intercellular adhesion completed to intercellular adhesion molecule—1 (CAM-1), or coligonuclectides can be used to modulate CAM activity in mediating considerable can be used for modulate CAM activity in mediating considerable can be used for modulating the synthesis of a CAM. Coligonucle can be used for modulating the synthesis of a CAM. Coligonucle to a disease or condition associated with a CAM. Oligonuclectides can be used for treating an inflammatory disease or condition e.g. inflammatory bowel disease such as Crohn's disease, colitists or ulcerative colitis, a condition of the skin, e.g. psoriasis or cytotoxic dermatitis, rheumatoid arthritis, allograft rejection, cancer, pneumonia, multiple sclerosis or a viral infection. The ICAM-1 sequences can also be used for reducing corticosteroid use in a patient or for reducing cyclosporine use in a patient. The oligonuclectides can also be used for detection and diagnosis. They can also be used for treating e.g. thyperproliferative disorders, tumours, diapedesis, graft versus host chyperaris, systemic lupus erythematosus, cardiovascular disorders, pemphigus conformations, ischaemia/reperfusion injury, dilated cardiomyopathy, acute myocarditis, ischaemic heart disease or stroke
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense oligonucleotides, used for treating e.g. inflammatory conditions, psoriasis, graft rejection, cancers, infections, cardiovascular disorders or autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example 10; Page 174; 199pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a method for predicting susceptibility to III infection or HIV progression in a subject. The method involves detecting a polymorphism in a human interleukin-10 (II-10) promoter, where the presence of the polymorphism indicates susceptibility to HIV infection or HIV progression. The method provides prognostic information to persons infected with HIV virus and is useful to help select treatments (such as administration of II-10 or gene therapy with II-10). The presence of polymorphism is useful as predictor that very aggressive treatment could substantially eradicate the virus from the infected person. The method is useful for the generation of normograms or other predictive algorithms that can be used, in association with allele status, to prognose probable survival or years to development of AIDS following HIV serconversion. It indicates that increased expression of the II-10 gene helps to reduce HIV-1 infection and pathogenic progression and enables a variety of new therapeutic interventions in the treatment of HIV disease. The present sequence represents a short tandem repeat (STR) primer which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC hypertrophic cardiomypathy, angina pectoris, myocardial infarction, cardiac arrhythmia, arteriosclerosis, kidney diseases such as acute renal cardiacy, renal glucosuria, renal infarction, nephrogenic diabetes consisted in the properties and inflammatory diseases such as asthma, excitentifis and confidence, reural trauma, psoriasis, cerebral malaria, osteoporosis, chematoid arrhritis, osteoportriis, toxic shock syndrome, contains, stroke, neural trauma, psoriasis, cerebral malaria, osteoporosis, crohn's disease, ulcerative colitis, Alzheimer's disease. Secreted protein DNA is useful in antisense-mediated gene inhibition and in gene cherapy. An array comprising one or more oligonucleotides complementary contecting cardiac, kidney and inflammatory disease. The present DNA sequence is an oligonucleotide which is used in the preparation of a commalised cDNA libraries are used in the identification of differentially expressed contails are used in the identification of differentially expressed contails are used in the identification of differentially expressed contails secreted factor DNAs. The normalised contails are used in the identification of differentially expressed contails are used in the identification of differentially expressed contails are used in the identification of differentially expressed contails are used in the identification of differentially expressed contails are used in the identification of differentially expressed contails are used in the identification of differentially expressed contails.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      comprising a fibronectin type III domain having a randomised loop, a randomised beta-sheet, or their combination, and has the capacity to bir to a compound that is not bound by a corresponding naturally- occurring fibronectin, immobilised onto a solid support. The antibody mimics is useful for detecting a compound preferably a protein, in a biological sample. It is also useful to detect one or more different analytes simultaneously in a sample. Hence is useful for diagnostic purposes. It is also useful for the purpose of designing proteins capable of binding to virtually any compound of interest. The present sequence is an oligonucleotide A18-2PEG linker used in an exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Fibronectin scaffold protein array for obtaining a protein/compound which binds to a compound/protein, comprises a fibronectin type III domain having a randomized loop, a randomized beta-sheet or their combination.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 18

Vaccinating against tumors, infectious diseases, allergies using immunostimulatory Py-rich and TG nucleic acids. and asthma

Claim 101; Page 56; 338pp; English.

response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an acid to a non-rodent subject in sufficient quantity to stimulate an acid to a non-rodent subject in sufficient quantity to stimulatory immune response. The present sequence is one such immunostimulatory nucleic acids can be pyrimidine rich nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects (py-rich) articles viral antiqens (e.g. herpesviridae, retroviridae) against tumour antigens, viral antigens (e.g. herpesviridae, retrovirid and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method also useful for preventing cancer, asthma, infectious disease, allergy immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the present sequence may have a phosphorothioate backbone The present invention relates to a method for stimulating an immune or or

The present sequence corresponds to polylinker DNA of the phagemid vector pCR2.1. It was used in the construction of a normalised rat CDNA library, which was used in an example demonstrating differential expression of a rat gene referred to as clone P00210D09. The invention relates to a polypeptide comprising a sequence of at least 80% identity to residues 22 -122 of the present sequence, or a sequence encoded by a nucleic acid hybridising under stringent conditions to the complement of the coding region comprising 1031 nucleotides, and having at least one biological activity of the polypeptide encoded by clone P00210D09. The polypeptides and polymucleotides of the invention are useful for the treatment of cardiac, renal and inflammatory diseases. The polymucleotides are useful in assays for identifying lead compounds that may be used as therapeutic agents in the treatment of cardiac, kidney or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the present sequence may have a phosphorothioate backbone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel secreted factor encoded by clone P00210D09 useful for diagnosing treating and/or preventing various cardiac, renal and inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WO200123419-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      nephrotropic;

                                                                                                            The present invention provides oligonucleotides, and methods for their use, which are useful in modulating the action of proteins involved in gastric acid production. The target protein is preferably the histamine H2 receptor or one of the proteins which form part of the gastric proton pump. The sequences and methods of the invention are useful in the treatment of gastric reflux, gastritis, dyspepsia, stomach ulcers, duodenal ulcers and other gastric acid disturbances, most of which are caused by Helicobacter pylori
                                                                                                                                                                                                                                          Treating gastric acid disturbance which modulates the activity of a production or secretion.
                                                                                                                                                                                                                                                                                                                                                                                                           30-NOV-2000

cc primer extension (SNPE) primers, and the sequences of regions flanking concludes kits for determining the presence or absence of regions flanking concludes kits for determining the presence or absence of a SNP, using the coligonucleotides of the invention. The PCR primers are used to amplify a coligonucleotides of the invention are primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by coligonucleotides are useful for genotyping a nucleic acid sample by coligonucleotides are useful for determining the presence, absence or cc identity of a SNP and for genotyping nucleic acid sample by clientity of a SNP and for genotyping nucleic acid samples, for e.g. to cassess by association analysis the genotype of an individual or group of cindividuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. cc osteogenesis imperfecta and acute intermittent pophyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial cd disease of which a component is or may be genetic scherois, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and cc paternity analysis. The present sequence represents a PCR primer specific cfor a human SNP containing DNA sequence

Crimer extension (SNPE) primers, and the sequences of regions flanking concludes kits for determining the presence or absence of a SNP, using the coligonucleotides of the invention. The PCR primers are used to amplify a CR SNP flanking sequence, the SNPE primer is used as a genotyping primer. The presence or absence of a SNP, using the CR SNP flanking sequence, the SNPE primer is used as a genotyping primer. CR SNP flanking sequence, the SNPE primer is used as a genotyping primer. CR coligonucleotides are useful for genotyping a nucleic acid sample by cased sease of a SNP and for genotyping nucleic acid sample by cased by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being cased by one or more SNPs. Phenotypic traits include diseases e.g. cagammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular cystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial confiseases, including, rheumatoid arthritis, multiple sclerosis, include microorganism. The method is also useful in forensic investigations and cuternity analysis. The present sequence represents a PCR primer specific for a human SNP containing NNA sequence.
                                                                                                                                  Matches
                                                                                                                                                                                     Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      polycystic kidney disease; osteogenesis imperfecta; autoimmune disease; acute intermittent porphyria; rheumatoid arthritis; multiple sclerosis; inflammation; forensic investigation; paternity analysis; PCR primer; s
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Single nucleotide polymorphism; SNP; single nucleotide primer extension; SNPE; genotyping; agammaglobulinaemia; diabetes insipidus; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SNPE; genotyping;

The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by performing single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or cligonucleotides are useful for determining the presence, absence or clentity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. capammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular of traits also include symptoms of or susceptibility to multifactorial conteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial consists also include symptoms of or susceptibility to multifactorial confidence of which a component is or may be genetic such as autoimmune diseases, including, rheumatoid arthritis, multiple sclerosis,

                                                            Consider extension (SNPE) primers, and the sequences of regions flanking concludes kits for determining the presence or absence of a SNP, using the coliquous coliquous that for determining the presence or absence of a SNP, using the coliquous flanking sequence, the invention. The PCR primers are used to amplify a CC The oligonuclectides of the invention. The PCR primers are used to amplify a CC performing a single-nuclectide primer extension reaction. The cC oligonuclectides are useful for determining the presence, absence or cC oligonuclectides are useful for determining the presence, absence or cC oligonuclectides are useful for determining the presence, absence or cC oligonuclectides are useful for determining the presence, absence or cC didn'tity of a SNP and for genotyping nucleic acid samples, for e.g. to casees by association analysis the genotype of an individual or group of casees by association analysis the genotypic traits include diseases, e.g. cC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular cC dystrophy, familial hypercholesterolaemia, polycystic kidney disease, cc osteogenesis imperfecta and acute intermittent porphyria. Phenotypic craits also include symptoms of or susceptibility to multifactorial cC disease of which a component is or may be genetic such as autoimmune cc inflammation, cancer, nervous system diseases and infection by pathogenic confirmation, cancer, nervous system diseases and infection by pathogenic confirmation, cancer, nervous system diseases and infection by pathogenic confirmation, rancer, nervous system diseases and infection by pathogenic confirmation, rancer, nervous system diseases and infection by pathogenic confirmation and confirmation 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Single nucleotide polymorphism; SNP; single nucleotide primer extension; SNPE; genotyping; agammaglobulinaemia; diabetes insipidus; cancer; Lesch-Nyhan syndrome; muscular dystrophy; familial hypercholesterolaemia;

                                                                                                                                       The present sequence is that of DNA-RNA-DNA hybrid oligonucleotide CC AGT02013. This is one of a set of oligonucleotides (see ABA91527-30) used CC to assess the minimum number of ribonucleotides in DNA-RNA chimeric CC oligonucleotides required for RNase H cleavage. Each oligonucleotide of CC the set had a different number of ribonucleotides, 2 in the present case. CC The oligonucleotides were mixed with target DNA oligonucleotide AGT02009 (see ABA91531) and incubated with RNase H (5 U/ml) at 37 degrees C for 30 CC minutes. The results showed that 4 ribonucleotides were the minimum CC number for RNA cleavage. The invention provides probes for nucleic acid Chybridisation. The probes form a hairpin structure comprising a double-stranded stem and a single-stranded loop, and are capable of both CC intramolecular and intermolecular hybridisation. The double-stranded stem CC RNase H cleavage. When the probe hybridises with a target DNA, the RNA CC RNase H cleavage when the probe sensitive to RNase H treatment and CC can be removed. Arrays and methods for nucleic acid hybridisation using C the probes are provided

CC The present invention relates to a method for analysing microsatellite CC loci. The method involves coamplifying a set of 3 microsatellite loci, CC comprising a specific mononucleotide repeat locus selected from the group CC consisting of BAT-25, BAT-26, BAT-40, MONO-11 and MONO-15 and two CC tetranucleotide repeat loci selected from FGA, DIS518, DI7S1299 etc from CC asample of genomic DNA and determining the size of the amplified CC fragments. The method is useful for analysing microsatellite loci and for CC detecting microsatellite instability (MSI) in genomic DNA. The CC instability in the set of microsatellite loci are used in prognostic CC tumour diagnosis for the diagnosis of familial tumour predisposition. It CC is also used to detect cancerous tumours in the gastrointestinal system CC and of the endometrium. The cancerous tumours are preferably from a CC colorectal cancer. The present DNA sequence is a PCR primer which is used CC for amplifying human MONO-15 locus. This primer is used in the
                                                                                                                                                                                                RESULT 2074

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     susceptibility to a disease associated with abnormal cell-cell adhesion between epithelial cells, comprising detecting a mutation in a nucleic acid encoding an adhesion protein, a protease or a protease inhibitor, or modulated level of adhesion protein, protease or protease inhibitor, or its fragment polypeptide. The method is useful for diagnosing a disease such as eczema, contact dermatitis, lung atopic asthma, post viral athma, bronchial hyper-reactivity, chronic obstructive pulmonary disease, Crohn's disease, ulcerative colitis, coeliac disease, peptic ulceration, impetigo, viral warts, meningitis, skin melanoma, squamous cell carcinoma, basal cell carcinoma, cutaneous lymphoma, skin cancer, malignancy of the gastrointestinal tract, malignancy of the lung,

The sequences are useful for treating cardiac, renal or inflammatory diseases. These include cardiac diseases such as congestive heart failure, myocardial infarction, cardiac arrhythmia, pulmonary hypertension, arteriosclerosis, atherosclerosis and cardiac tumours, renal diseases such as glomerulonephritis, nephrotic syndrome, renal infarction, hereditary nephritis, polycytic kidney disease, chronic renal failure, renal vein thrombosis and medullary sponge kidney and inflammatory diseases such as asthma, rheumatoid arthritis, osteoarthritis, stroke, psoriasis, restenosis, graft versus host reaction, Crohn's disease, ulcerative colitis and Alzheimer's disease. Sequences AAS9463-AAS94745 represent cDNA clones, which encode the correct of feature coloration of the invention of the content of the conte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  renal infarction; hereditary nephritis; polycystic kidney disease; chronic renal failure; renal vein thrombosis; medullary sponge kidney; rheumatoid arthritis; osteoarthritis; psoriasis; restenosis; PCR primer; graft versus host reaction; Crohn's disease; ulcerative colitis; probe;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid timour growth,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Inhibiting angiogenesis in a subject, antiangiogenic nucleic acid molecule

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolential fibroplasia, which is the production of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              11-JUL-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Inhibiting angiogenesis in a subject, antiangiogenic nucleic acid molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     14-DEC-2001;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound gramulation, intestinal adhesions, atherosclerosis, scleroderma hypertrophic scars. protein, factors for generating or detoxifying reactive oxygen species (ROS) and factors for blocking and/or by-passing of caspases. They are useful for tumour therapy. Cytotoxic proteins of the invention are useful for destroying tumours and/or selectively killing cells in tissues, for identifying novel targets for the development of pharmaceutical agents, preferably anti-tumour agents and as specific ion channel modulators, e.g., blockers or openers for therapy, diagnostic or research. They are useful for the diagnosis and therapy of hyperproliferative diseases, preferably tumours, e.g., leukaemia, carcinoma, sarcoma and melanoma. They are also useful for development of drugs for the treatment of they are also useful for development of drugs for the treatment of disease, where the diseases such as Alzheimer's disease, preferably tumours of the seases such as Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             activity obtainable from sea hare Aplysia. Sequences of the invention useful for the manufacture of cytotoxic agents against apoptosis-resistant cells, where the agents are useful for diagnosis, prevention treatment of disorders associated with dysfunctions of GAP-SH3 binding
arteriosclerosis, heart diseases, stroke and vascular diseases. The present sequence is an oligonucleotide which is used for amplifying sea hare cyplasin L DNA. This sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 5; Page 37; 87pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           present invention relates to novel polypeptides having cytotoxic

Arraying genome clones.

Claim 4; Page 5; 528pp; Japanese.

XAXFXBXBXBXBXBXBXBXBXBXBXBXAXXBXAAX The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified by using the above primer; (g) signals are detected from the amplified by using the above primer; (g) signals are detected from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL43957 to ABL45327 represent the proportions for human chromosome and arrayed.
                The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           11-APR-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PCR primers for human chromosome 1036-35 DNA, and ABL45323 to ABL45634 represent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       JP2001321190-A.

resultant cultures

<u>(</u>

second strand cDNA synthesis through a mechanism of terminal continuation. In the method an RNA molecule is obtained and a first primer is added that comprises a region that hybridises to a complementary region of the molecule before a second primer is added comprising at least one riboguanine at the 3' end of the primer. A first comprisentary nucleic acid molecule is synthesised, the RNA molecule and second primer are removed and a second complementary nucleic acid molecule is synthesised to form a second hybrid with an extension product of the third primer bound to the first complementary molecule. The method of the invention is useful for increasing the efficiency of second strand cDNA synthesis and may be used for linear amplification of genetic signals from histologically stained tissue. The present sequence

This invention relates to a novel method for increasing the

efficiency

of.
